Silicone-coated polyurethane foam dressing

“Absorbent foam dressing with a soft silicone adhesive layer”

- Silicone Adhesive Layer is perforated at regular intervals to provide excellent absorbency without interfering the absorption of polyurethane foam.
- It is used for wound that secretes various amount of exudate and can be used at any time where thin foam dressing is required.
- The polyurethane foam contains alginate component, so it contacts the blood of the wound and forms a gel, which is effective for hemostasis of the wound by ion exchange.
- Increase the wound healing rate by creating a moist environment on the wound area.
- The durability of silicone is excellent, and adhesive force is maintained for a long time.
- It can be cut and used according to the wound size. Second dressing is required if necessary.
